

Rainwater tank in Günzburg

In Günzburg at Ulm, Germany a rainwater tank was constructed in September 2000. Here Formtex[®] was used to minimize growth conditions for algae. Furthermore a strong and resistant surface was needed to avoid the penetration of aggressive elements.

The casting of the west-wall and the finished north-wall

Process

Formtex[®] was used for this project - the liner was used twice.

Installation

For fixing the Formtex[®] the tensioning method was used as the elements were of a fit dimension

Casting of the west-wall

The concrete is vibrated and the water escapes under the formwork
